"A 570-kb DNA sequence of the Bscherichia coli K-12 genome
corresponding to the 28.0-40.1 min region on the linkage map.";

I. DNA Res. 3:363-377(1996).

I. FUNCTION: Necessary for host cell lysis. It is believed to code
for an endopeptidase that cleaves the amino-carboxyl cross-link
between the diaminopimelic acid and D-alamine residues in the
murch component of the bacterial cell wall (By similarity).

C.-I. SIMILARITY: BELONGS TO PEPTIDASE FAMILY UB. STRONG, TO LAWBDOID
PHAGES ENDOPEPTIDASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Lactococcus lactis (subsp. cremoris) (Streptococcus cremoris).

Isold = 043570-2; Sequence = VSP 000772; Nowe 2. Isold = 043570-2; Sequence = VSP 000772; Note = No experimental confirmation available; INCERTY = VEROITY: HIGHLY EXPRESSED IN COLON, KIDNEY, PROSTATE, INTESTINE AND ACTIVATED LYMPHOCYTES. EXPRESSED AT MOCH HIGHER LEVELS IN THE RENAL CELL CANCERS THAN IN SURROUNDING NORMAL KIDNEY FISSUE. MODERATELY EXPRESSED IN PANCREAS, OVARY, AND TESTIS. SIMILARITY: Belongs to the eukaryotic-type carbonic anhydrase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Signal; Alternative splicing;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CARBONIC ANHYDRASE XII.

                                                                                                                                                                          Science 269:496-512(1995).

-!- FUNCTION: Component of the transport system for branched-chain amino acids (leucine, isoleucine and valine) Which is coupled to proton motive force (By similarity).

-!- SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane.
-!- SIMILARITY: BELONGS TO THE BRAC/BRAZ/BRNQ FAMILY OF TRANSPORTERS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Bukaryota, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi,

Mattei M.-G., Thies U.; and 2, members of the fork head gene family, are clustered on chromosome 14q."; Biochim. Biophys. Acta 1262:105-112(1995).

-!-FUNCTION: Plays an important role in the establishment of the regional subdivision of the developing brain and in the development of the telencephalon. Sequence-specific DMA-binding protein with a distinct binding specificity (By similarity).
-!-SUMCELLULAR LOCATION: Nuclear (Potential).
                                                                                                                                     Murphy D.B., Wiese S., Burfeind P., Schmundt D., Mattei M.-G.,

-! SIMELLULAR LOCATION: Nuclear (Potential).
-! TISSUE SPECIFICITY: Retina and brain.
-! DEVELOPMENTAL STAGE: Can be detected in regions including prinordial retina and neuroepithelium by embryonic day 2 (R2). At E3, expressed in the nasal retina and pigment epithelium as well as in the telencephalon, and at E7 is expressed in retinal ganglion cells. Levels begin to decline from E4 and almost disappear by E10.
-! SIMILARITY: Contains 1 fork-head domain.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RESULT 2 T42737 셤

91330 protein precursor - rat
NyAlternate names: megalin
C;Species: Rattus norvegicus (Norway rat)
C;Date: 11-Jan-2000 #sequence_revision 11-Jan-2000 #text_change 04-Mar-2000
C;Accession: T42737
R;Saito, A.; Pietromonaco, S.; Loo, A.K.C.; Farquhar, M.G.
Proc. Natl. Acad. Sci. U.S.A. 91, 9725-9729, 1994

My Title: M-protein of glycine decarboxylase is encoded by multigene families in Flaver: My Efference number: S60194; MUID: 96140454; PMID: 8552027

My Reference number: S60198

A, Reference number: S60198

A, Molecule type: DNA

My Molecule type: DNA

My Residues: 1-161 < KODP>

My Experimental source: EMBL: Z37522; NID: 9547499; PIDN: CAA85759.1; PID: 9547500

My Residues: Source: tissue type leaf

My Rote: the nucleotide sequence was submitted to the EMBL Data Library, September 1994

                                                                                                                                                                                                                                                                                                         Glycine cleavage system protein H precursor (clone HFC2) - Plaveria cronquistii
NyAlternate names: H-protein
NyAlternate names: H-protein
C;Species: Flaveria cronquistii
C;Date: 19-Mar-1997 #sequence_revision 19-Mar-1897 #text_change 20-Aug-1899
C;Accession: S49230; S60197
C;Accession: S49230; S60197
C;Accession: Datue, H.
Submitted to the EMBL Data Library, September 1894
A;Pescription: Molecular cloning and comparative analysis of H-protein of glycine decark
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A Molecule type: DNA

Sequence 2, Application US/09742201

Sequence 2, Application US/09742201

Patent No. US20020123091A1

GENERAL INFORMATION:

APPLICANT: Gurney, Austin L.

APPLICANT: Wood, William I.

TITLE OF INVENTION: For Use in Modulation of Hepatocyte Growth Factor Act:

TITLE OF INVENTION: For Use in Modulation of Anglogenesis and Cardiovascularization

FILE REFERENCE: P1861R1US

CURRENT APPLICATION NUMBER: US/09/742,201

CURRENT FILING DATE: 2000-12-19

PRIOR PLING DATE: 2000-02-11

PRIOR PLING DATE: 2000-03-15

PRIOR PLING DATE: 2000-03-15

PRIOR PLING DATE: 2000-03-15

PRIOR PLING DATE: 2000-11-28

NUMBER OF SEQ ID NOS: 6

This represents a human secreted protein. The specification provides secreted protein sequences (AAM63681 to AAM63699) encoded by the nucleic acid sequences shown in AAV43601 to AAV43619. The invention provides a method of identifying a secreted polypeptide which is modified by rough microsomes. The secreted proteins can be used in assays to determine biological activities, such as cytokine, cell proliferation, or cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Secreted protein; human; cell proliferation; cytokine activity; tissue growth; cellular differentiation; regeneration; activin; inhibin; chemotactic; haemostatic; thrombolytic; tumour inhibition; anti-inflammatory activity; blomarker.

inhibin activity, chemotactic or chemokinetic activity, haemostatic or inhibin activity, chemotactic or chemokinetic activity, haemostatic or thrombolytic activity, receptor/ligand activity, tumour inhibition, or anti-inflammatory activity. The proteins can also be used as biomarkers, to identify tissues or cell types which express the proteins, or a stage-or disease-specific alteration in protein expression. They can be used in protein interaction assays, to identify ligands or binding proteins. Compounds which affect the biological activities of the secreted proteins or their ability to interact with specific ligands can be identified using the proteins in screening assays. The proteins and antibodies that contract with specific ligands can be identified using the proteins in screening assays. The proteins and antibodies that the protein compositions for diseases which may be associated with altered expression of these proteins. Fusion proteins comprising, or signal sequences or transmembrane domains of the proteins can be used to target other protein domains to cellular membrane or they can be secreted extracellularly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The inhibitor, which was isolated from the human cancer cell line MKN45, can be used as an in vivo or in vitro regulatory factor for HGF or HGFA. It can also be used to raise antibodies, useful in kinetic studies of the inhibitor, or as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a preventive and/or treating agent for the diseases caused by the exasperation of activity of protease of plasma kallikrein, plasmin, urokinase and trypsin. The agent contains a protein, HAI-1 which has the following properties, M.W. of ca. 40,000 to 57,000 balton by SDS-PAGE and an activity of inhibiting protease activity of hepatocyte growth factor (HGF) activator. The HGF inhibiting activity of the protein is specific. HAI-1 shows a high inhibiting activity of plasmin, trypsin, HGF activator and plasma kallikrein but substantially no inhibiting activity on thrombin. This sequence represents the human HAI-1 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   308 MERRHPVCSGTCQPTQFRCSNGCCIDSFLECDDTPNCPDASDEAACEKYTSGFDELQRIH 367

Claim 1; Page 263-264; 311pp; English.

ô

The present invention relates to the isolation of human protein modification and maintenance molecules (PAMM), and the polymucleotide modification and maintenance molecules (PAMM), and the polymucleotide sequences encoding them. A total of 40 PAMM polypeptides (designated PAMM-1 resquences encoding them. A total of 40 PAMM polymucleotides are disclosed. The sequences of the invention are useful for disapposing a condition of disease associated with the expression of PAMM in a subject, preparing a polythonal or monoclonal antibody, and polymucleotides. The disease or conditions associated with decreased expression or overexpression of PAMM are cell proliferation disorders (e.g. cancer, atherosclerosis), neurological disorders (e.g. epilepsy, Huntington's disease, stroke), immune/inflammatory disorders, (e.g. allergies), developmental disorders (e.g. hypothyroidism, Cabhing's allergies) asstrointestinal disorders (e.g. hypothyroidism, Cabhing's PAMMM polypeptides or their fragments are useful in screening compounds for effectiveness as agonists or antagonists of the polypeptides, or in

The present sequence is that of novel human immunomodulator PR0256 (UNQ223), as deduced from cDNA (see AAF30055) isolated from a placental tissue library. PR0256 (See R. Ma., p16.22) shows sequence homology to human bikunin protein, suggesting protease-inhibitor activity. The invention proteins proteins of proteins (see AAF30050.62) encoding novel human PR0 provides polymucleotides (see AAF30050.62) encoding novel human PR0 comprising these proteins or their agonists are useful for increasing the proteins of inflammatory calls into a tissue of a mammal; stimularing comprising an immune response, or increasing the proliferation of T-1 (Inflammatory propagate) or increasing the proliferation of T-2 (Inflammatory propagate) or increasing the proliferation of T-3 (Inflammatory myopathy, Siogrefur is selected from a propagate in the proliferation of the proliferation of thromborytopaenia, autoimmune haemolytic anaemia, autoimmune thromborytopaenia, thyroiditis, diabetes mellitus, immune-adiated diseases (such as multiple sclerosis), autoimmune conclusis, granulomatous conclusis, sacrosidosis, primary biliary cirrhosis, granulomatous conclusis and Crohn's diseases (such as multiple sclerosis), autoimmune-mediated skind seases (such as bullous skin disease, (autoimmune-mediated skind seases (such as bullous skin diseases (autoimmune-mediated skind as graft relegation), immunologic diseases (the lung and transplantation cartive diseases (autoimmune-mediated skind as graft relegation), allergic rhinities, atogic dermatities, allergic relegation of disagnosing these discrets comprise detecting the level of expression of the PRO gene. Also claimed are method of indentifying a compound capable of inhibiting the proliferation of artivity of the PRO polypoppide, verificanti
Peptide
                                                                                                                                                                                 Domain

The present invention relates to PRO256 or its agonist/antagonist may be used to treat a cardiovascular, endothelial, or angiogenic disorder in a mammal, especially a human with cardiac hypertrophy, trauma, a type of tumour or age-related macular degeneration. PRO256 may be administered together with a cardiovascular, endothelial, or angiogenic agent, a chemotherapeutic agent, a growth inhibitory agent, or a cytotoxic agent. PRO256 may also be used to treat the disorders above, preferably through administration via ex vivo gene therapy. PRO356 or its agonist may be used to inhibit endothelial cell growth, angiogenesis or protease activity of a hepatocyte growth factor. Whereas an antagonist of PRO256 may be used to stimulate endothelial cell growth, angiogenesis or protease activity of a hepatocyte growth factor. Stimulation or inhibition of the protease activity of a hepatocyte growth factor. Stimulation or inhibition of the protease activity of a hepatocyte growth factor is preferably carried out where a mammal has a cardiovascular, endothelial, or angiogenic disorder selected from peripheral vascular disease, hepatic or remal injury or a restinosis disorder. The present sequence is human hepatocyte growth factor activator inhibitor, PRO256
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     324 MERRHPVCSGTCQPTQFRCSNGCCIDSFLECDDTPNCPDASDEAACEKYTSGFDELQRIH 383

The PRO polypeptides, agonists, antagomists or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leukaemias and iymphoid malignancies, other disorders such as neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, stromal and blastocoalic disorders, inflamatory, immune and angiogenic disorders. The polymucleotide sequences are also useful in gene therapy, AAU86122 represent the human PRO polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Thirty five nucleic acids encoding PRO polypeptides, useful for treating benign or malignant tumors, leukemias and lymphoid malignancies, inflammatory, angiogenic and immunologic disorders.
                                                                                                   Human; PRO; benign tumour; malignant tumour; lymphoid malignancy;

ABL88072 to ABL88258 encode the PRO proteins given in ABB84817 to all ABB85003. The PRO proteins and polymucleotides have cardiant, cytostatic, antiangiogenic, hypotensive, vulnerary and antiarteriosclerotic activities, and can be used in gene therapy. The PRO polymucleotides, proteins, agonists and antagonists are useful for treating or diagnosing cardiac hypertrophy, traums, cancer, age-related macular degeneration, atherosclerosis, hypertension, atterial restences, rheumatoid arthritis, angina, myccardial inferctions, thrombophebitis, lymphangitis, tumour angiogenesis (such as breast cartinoma and liver cardinoma) and wound healing. The PRO polymucleotides have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. ABL88159 to ABL8825, represent primers and probes used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         324 MERRHPVCSGTCQPTQFRCSNGCCIDSFLECDDTPNCPDASDEAACEKYTSGFDELQRIH 383

This invention relates to the cDNA and protein sequences of novel secreted and transmembrane polypeptides PRO polypeptides. The invention also comprises a method for producing the proteins of the invention by recombinant means and antibodies specific for the protein of the invention by recombinant means and antibodies specific for the protein of the invention. The antibody may be used for detecting the PRO proteins of the invention and may be used to modify their activity. polymucleotides may be used as hybridisation probes for a cDNA library to isolate the full-bength PRO cDNA or to isolate other CDNAs, to construct hybridisation probes for mapping the gene which encodes that PRO and for genetic analysis of individuals with genetic disorders, in assays to identify other proteins or molecules involved in binding reaction, to generate transgenic animals or knock-out animals which in turn are useful in the development and screening of therapeutically useful reagents, for chromosome identification, and tissue typing. The PRO polypeptides are useful in gene therapy, and as molecular weight markers for protein electrophoresis purposes. The sequences may also be used to detect oversappession on PRO polypeptides in cancerous tumnurs and for screening for differentially expressed genes using microarray technology. The present sequence represents a human PRO protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New PRO polypeptides and polynucleotides encoding the polypeptides, useful in gene therapy, chromosome identification, tissue typing, or for genetic analysis of individuals with genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               124 MERRHPVCSGTCQPIQFRCSNGCCIDSFLECDTPNCPDASDEAACEKYTSGFDELQRIH

                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides the protein and coding sequences of human PRO proteins. These are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, mycoardial infarention, thromopolibeliis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The present sequence is a PRO protein of the invention

WPI; 2003-625484/59. N-PSDB; ADA01277.

Novel isolated PR01313, PR020080 or PR021383 polypeptide useful for stimulating proliferation of human microvascular endothelial cells, and PR05018 polypeptide useful for stimulating proliferation of chondrocyte

Claim 11; Fig 10; 307pp; English.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TWP-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a memmal (e.g. adrena), lung, colon, breast, prostate, rectal, cervical and liver tumours). The proliferation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. Including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in penerating either transgenic animals or knock-out animals which are useful in the development and streeming of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microwascular endothelial cells, for inducing endothelial cell cantilage defects, osteobatrhitis and rheumatoid arthritis. This sequence represents a human PRO polypeptide of the invention.

WPI; 2003-605867/57. N-PSDB; ADA43706. New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO20080 or PRO21383, useful in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy.

Claim 11; Fig 10; 308pp; English.

The interaction relates to an insolated secreted. Transmenaries (FRO) to polypeptide, having at least 80% sequence identity to a sequence selected from any one of the 57 amino acid sequences given in specification, or to a sequence encoded by a nucleic acid molecule selected from any one of the 57 amino acid sequences given in specification, or to a nucleic acid deposited under any of the ATCC accession numbers given in specification, or a sequence having at least 80% identity to PRO in specification, or a sequence having at least 80% identity to PRO in specification, or a sequence having at least 80% identity to PRO with or without its associated signal peptide. Also included are vectors, transformed host calls, anti-PRO antibodies, the nucleic acids encoding PRO, PRO tusion procteins, inducing endothelial call tube formation (by administering PRO281, PRO1560, PRO189, PRO4499, PRO4499, PRO6800, PRO150175, PRO12107, PRO22031 or PRO481274 polypeptide or its agonist) and oligonucleotide probe derived from any one of the above nucleotide sequences. PRO6018 polypeptides are useful for stimulating the proliferation of human microvascular endothelial cells. PRO6071, PRO4497 and PRO6006 and PRO2133 polypeptides are useful for stimulating the proliferation of human microvascular endothelial cells. PRO polypeptides are useful for inhibiting endothelial cells. PRO 2019 PRO497 and PRO6006 PRO189, PRO6009, PRO6009, PRO499, PRO6009, PRO6009, PRO1809, PRO6009, PRO1809, PRO6009, The invention relates to an isolated secreted/transmembrane (PRO)

The invention relates to an isolated secreted/transmembrane (PRO)

CO polypeptide, having at least 80% sequence identity to a sequence selected from any one of the 57 amino acid sequences given in specification, or to a sequence encoded by a nucleic acid molecule selected from any one of the mucleic acids deposited under any of the ATCC accession numbers given in specification, or a sequence having at least 80% identity to PRO lacking its associated signal peptide, an extracellular domain of PRO with or without its associated signal peptide. Also included are vectors, transformed host cells, anti-PRO antibodies, the mucleic acids encoding PRO, PRO, PRO fusion proteins, inducing endothelial cell tube formation (by administering process). PROSO93, Or PROJO275, PROSO93, Or PROSO93, or PROSO93, or enclanded are vectoride proceinde probe derived from any one of the above nucleotide sequences. PROSO133 or propertide is useful for stimulating the proliferation of proliferation or differentiation of chondrocyte cells. PROSO133, PROSO080 cc multiple polypeptides are useful for stimulating the proliferation of human corovascular endothelial cells. PROSO31, PROSO93, PROSO06 colon, breast, prostate, rectal, kidney and liver. PROS31, PROSO03 colon, breast, prostate, rectal, kidney and liver. PROS31, PROSO93 and PROSO3474 polypeptides are useful for inducing endothelial cell tube for proliferation of human colon, breast, prostate, rectal, kidney and liver. PROS31, PROSO933 and PROSO34274 polypeptides are useful for inducing endothelial cell tube for maticoance of tumour in a mammal including the proliferation of medicament for treating a condition responsive to PRO polypeptide. The antibody are useful in the preparation of medicament for treating a condition responsive to PRO polypeptide. The New secreted and transmembrane PRO polypeptides, e.g. PRO20080 or PRO21383 useful for stimulating the proliferation or differentiation of chondrocyte cells and detecting the presence of a tumor in a mammal. /clone_lis strand cDNA was primed with a NotI-oligo (dT)
primer. Five prime end enriched, double-strand cDNA was
digested with Not I and cloned into the Not I and EcoR V
sites of the pCMVSPORT 6 vector. Library was normalized.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CCCAGCACAGGCTCTGTGGGTGTGGCTGTTGCTGGTCATCTGCATTGTGGTG
